(I promise I'll try and take a picture of it soon!) I was also featured on Reddit a little while back, I was so surprised! This was a beautifully made and thoughtful gift, thank you so much! I just finished exploring the Amish Market this afternoon, just a few more pics to go! Here's a few more shots from there! Just finished up at the house! I hope to have another blog post up in a bit, this one is a bit longer than usual. I forgot to take a picture of the inside of the door before I went to post this, but here it is anyways! Here's the rest of the door, inside I saw another glider and a really neat wall display. Here's the other side of the door. Next stop, the shop! Lots of interesting things to see! I'm not sure what this thing is, I'm guessing it's a tool. And of course, I had to check out the chocolate display! And there's more!

Fibroblast growth factor 2 (FGF-2) is a potent mitogen for vascular smooth muscle cells. We have used microarray analysis to study the changes in expression in vascular smooth muscle cells (VSMC) after stimulation with FGF-2 and the involvement of signal transduction pathways in these effects. The overall goal of these studies is to identify components and pathways important in the mitogenic response of VSMC to FGF-2. We demonstrate that activation of human VSMC with FGF-2 results in the up-regulation of multiple genes and that the mitogenic activity of FGF-2 can be inhibited by the MAPK pathway inhibitor U0126. We show that the activation of ERK1/2 and p38 MAPK are necessary for the up-regulation of cyclins and cdc2 by FGF-2. However, we found that the activation of the PI3-kinase pathway is also necessary for the full activation of the MAPK pathway. We also show that different kinase inhibitors result in different expression profiles. The cell type and stimulus will determine which kinase inhibitor will be most effective. Thus, this study shows that molecular mechanisms of signal transduction are important in controlling the mitogenic response of VSMC to FGF-2
