Q: Why does scalar multiplication not work on the ring of Gaussian integers? I have noticed that scalar multiplication of Gaussian integers does not give back a Gaussian integer, despite the fact that the ring of Gaussian integers is a field (with order 4). In fact, for a Gaussian integer α :
$$\alpha \cdot 1 = \alpha \quad \alpha \cdot i = ai + b$$
 while for $\alpha = 2 \pm 3i$:
$$\alpha \cdot 1 = 2 \pm 3i \quad \alpha \cdot i = \pm 6i + 1$$
 should be their corresponding multiples in the base field $GF(7)$. However, $1 = 2$ and $6 = 1$. I was wondering if anyone could explain the differences in these

two cases. Does this difference come from the fact that $\alpha = 2 \pm 3i$ is a sum of vectors (rather than a scalar, like $2 \pm 3i$)? If so, what is the mathematical connection of scalar and vector multiplication? A: α is what we usually call a complex number. Schematically, $\alpha = a + bi$ where $a, b \in \mathbf{R}$. The magnitude of a complex number α is $|\alpha| = \sqrt{a^2 + b^2}$. In your case, it's $7\sqrt{3}$. But $\sqrt{3}$ is not an integer, so $|2 \pm 3i| = 7\sqrt{3}$ is not an integer. You seem to confuse i with $i^2 = -1$. The reason it's not a number from \mathbf{Z} is not as its magnitude is not a number from \mathbf{Z} , but rather from \mathbf{Q} . ---
